

代码Lab03-订单模块

组员信息

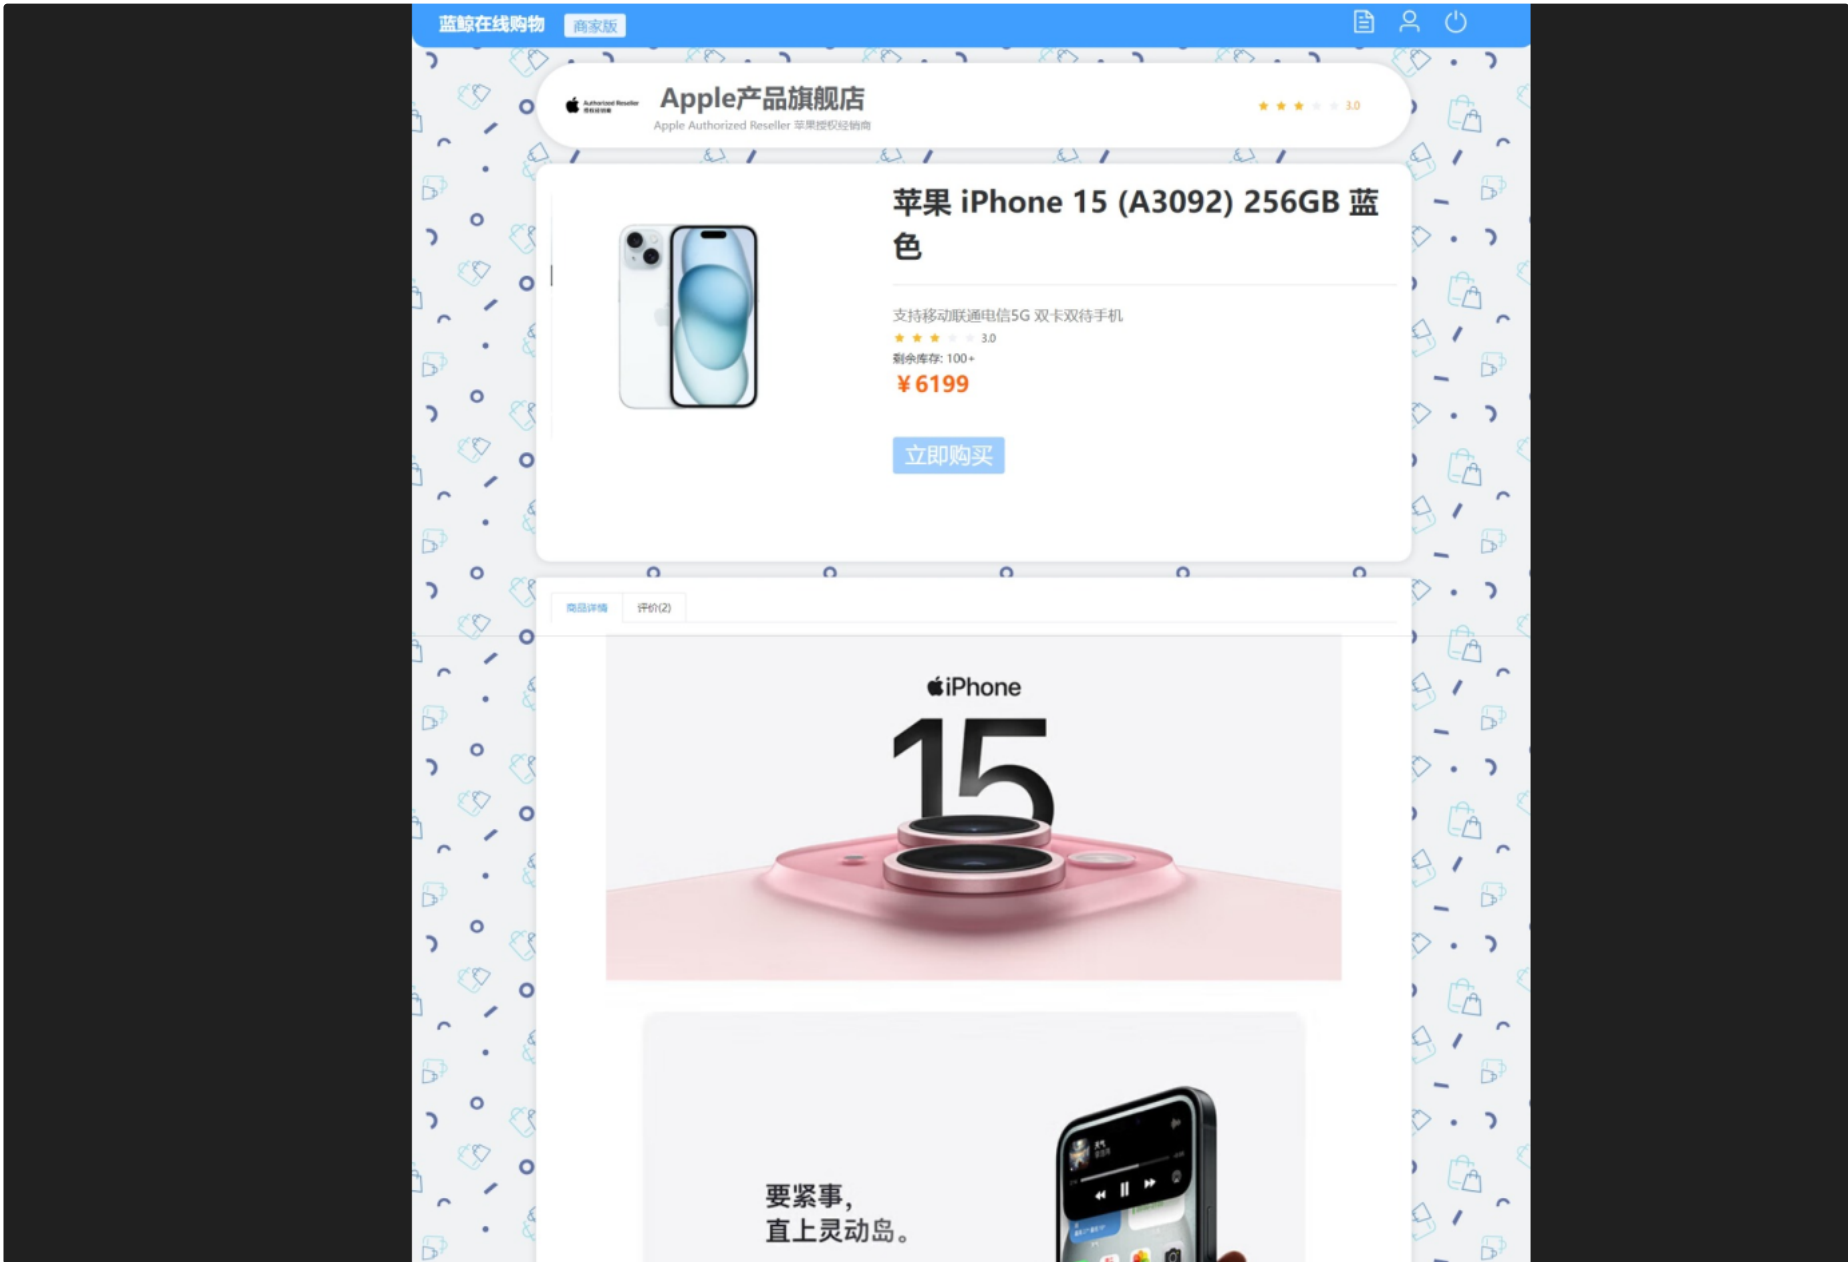

姓名	学号	电话
刘存玺	221850148	17318601136
董天诺	221250004	13264512313
史创屹	221250106	15385019512
杨枫	221250155	18976304216

前端具体实现

商品详细页面

商品详情图

- 商品除了展示图之外，还可以有二级详情介绍图。
- 商品创建时可以上传详情介绍图

库存显示

- 商品拥有库存的显示
- 库存大于100时，显示为100+；库存小于100时，显示具体数字；库存为0时，显示为0，并且购买按钮变为无货按钮

- 使用v-if实现

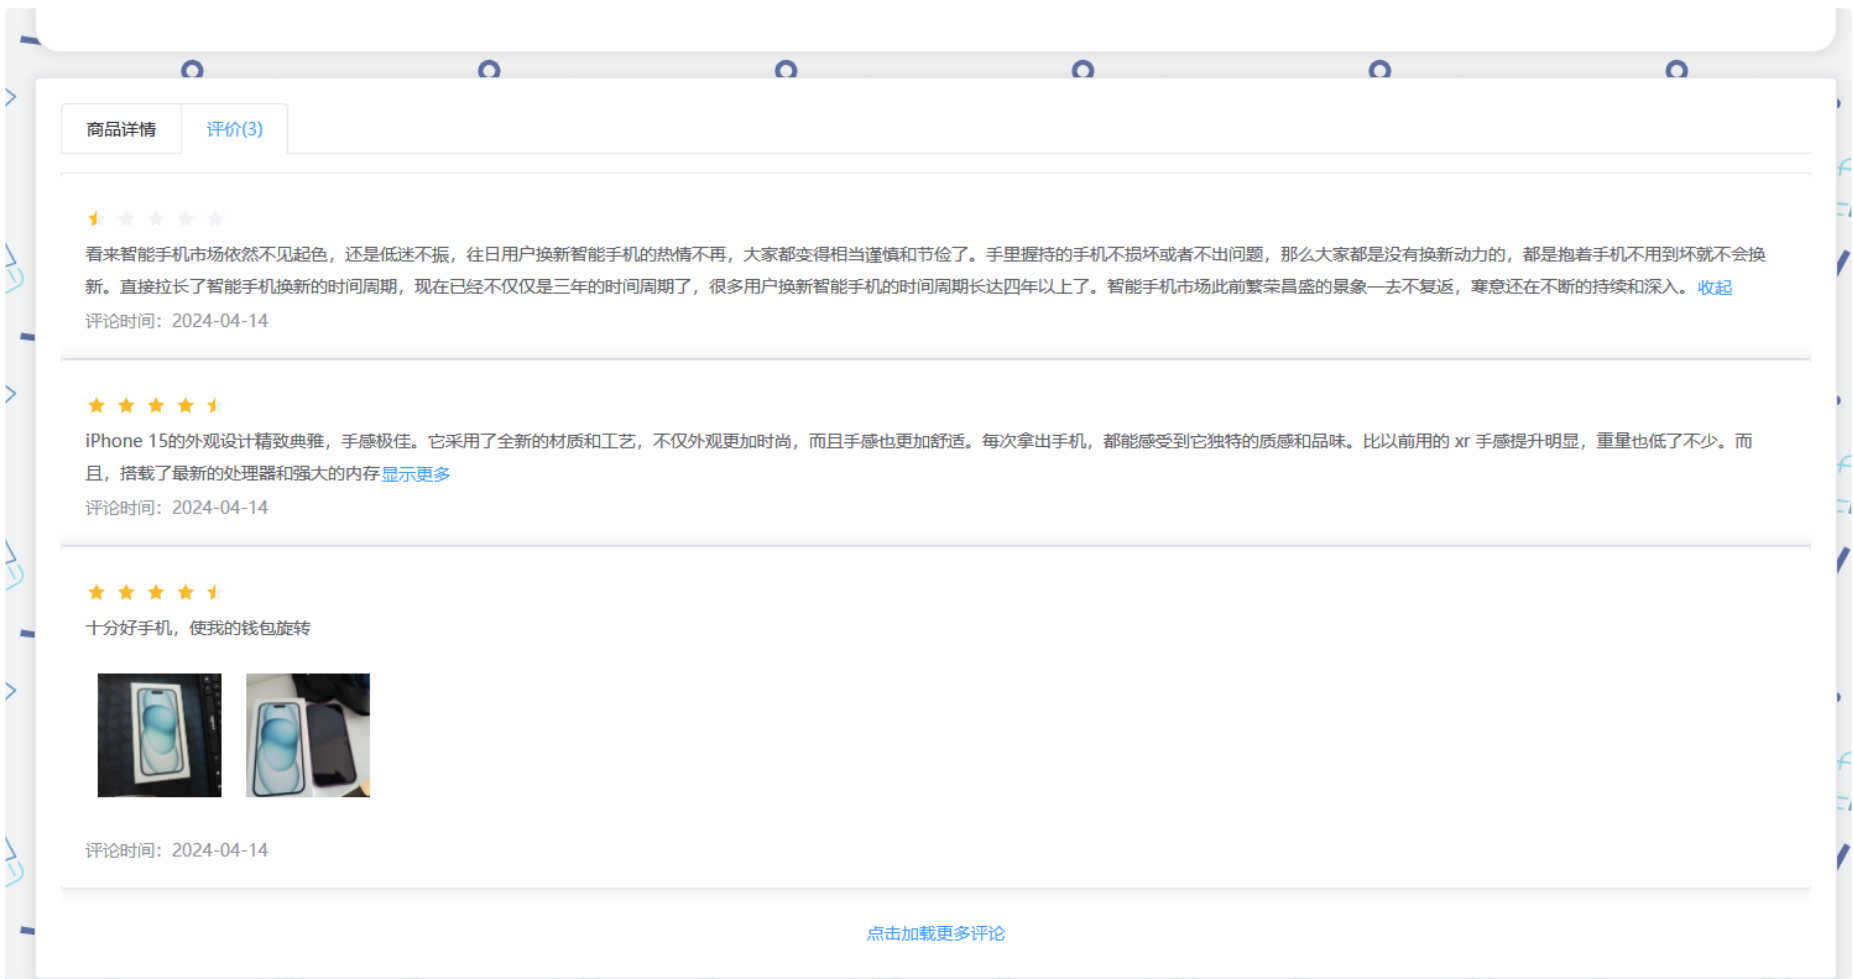

```
<el-row v-if="product.inventory > 100">剩余库存: 100+</el-row>
<el-row v-if="product.inventory ≤ 100">剩余库存: {{product.inventory}}</el-
row>
<el-row class="price-text">¥ {{product.price}}</el-row>
<el-button type="warning" v-if="product.inventory ≤ 0" :disabled=true
  @click="handleToPurchase">暂时无货</el-button>
<el-button type="primary" v-if="product.inventory > 0" :disabled="role ≠
  'CUSTOMER'" @click="handleToPurchase">立即购买</el-button>
```

购买权限

- 对应lab3文档的需求1
- 只有顾客可以购买商品，其他Role在商品详细界面的购买按钮不可用

评论区

- 对应lab3文档的需求7
- 商品的评论区也处于商品详细界面内。与商品详情介绍处于同一个标签页下，可以通过标签页头进行切换浏览。
- 众多评论采用懒加载，以应对评论数量巨大的情况。点击加载更多评论 可以实现评论的加载
 - 加载到底时，按钮文字会变为到底啦 并且不可继续点击
- 评论字数过多会进行折叠，可以点击显示更多 来进行展开。展开之后也可以点击收起 来关闭
- 评论的标签栏处会显示商品总评论个数（是总个数，不是当前懒加载了多少条）， 对应lab3文档的需求6

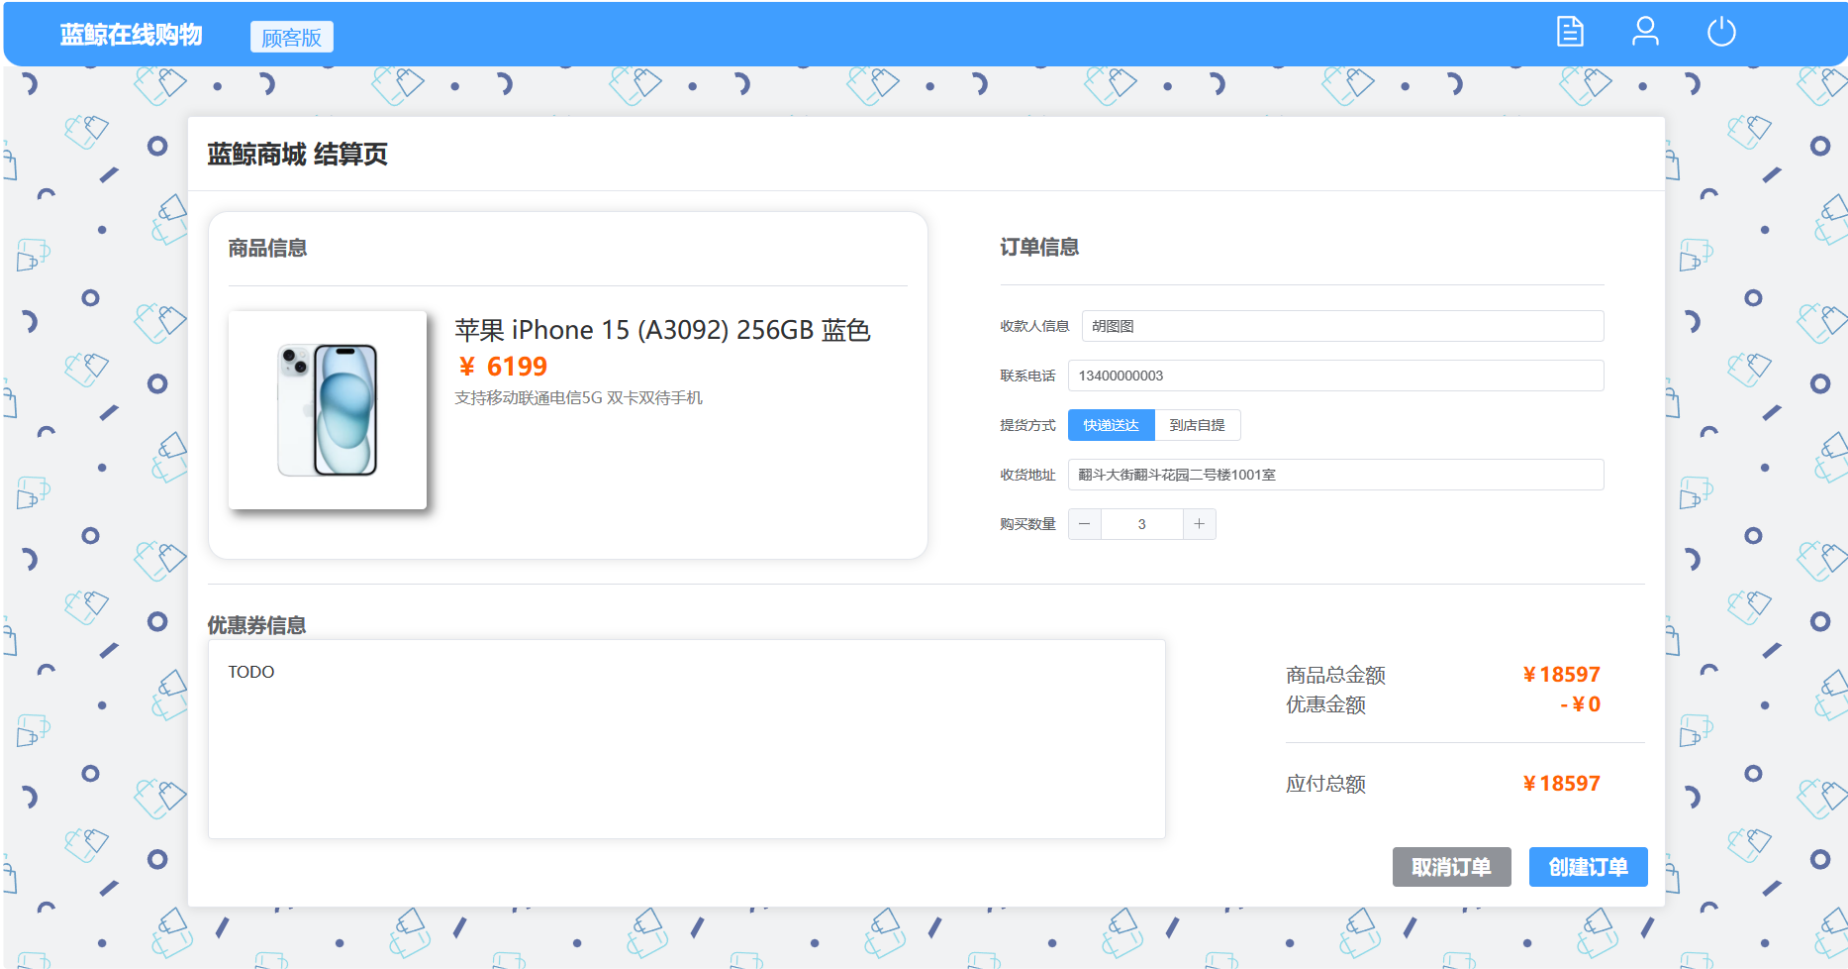

```
function handleLoadComment(){
  reqCommentList({
    itemId: parseInt(productId.value),
    startInd: commentList.value.length
  }).then(res => {
    if(res.data.result.length === 0){
      // 评论区到底了
      commentListEnd.value = true
    }
    else{
      commentList.value.push(...res.data.result)
    }
  })
}
```

```
<el-tab-pane :label="'评价(' + commentCount + ')">
  <el-container style="display: flex; flex-direction: column; align-items: center">
    <CommentItem style="width: 100%" v-for="item in commentList"
      :key="item.id" :comment-info="item"></CommentItem>
    <el-button style="margin-top: 20px" type="text"
      @click="handleLoadComment" v-if="!commentListEnd">点击加载更多评论</el-button>
    <el-text style="margin-top: 20px" v-if="commentListEnd">到底啦</el-text>
  </el-container>
</el-tab-pane>
```

创建订单页面

订单创建

- 对应lab文档需求1
- 订单信息的表单会自动读取用户注册时的信息
- 顾客也可以临时更改信息
- 顾客可以选择提货方式为快递或自提
 - 选择自提时，收货地址一栏自动消失
- 购买数量最小为1，最大不超过库存数量
- 显示当前应付总额

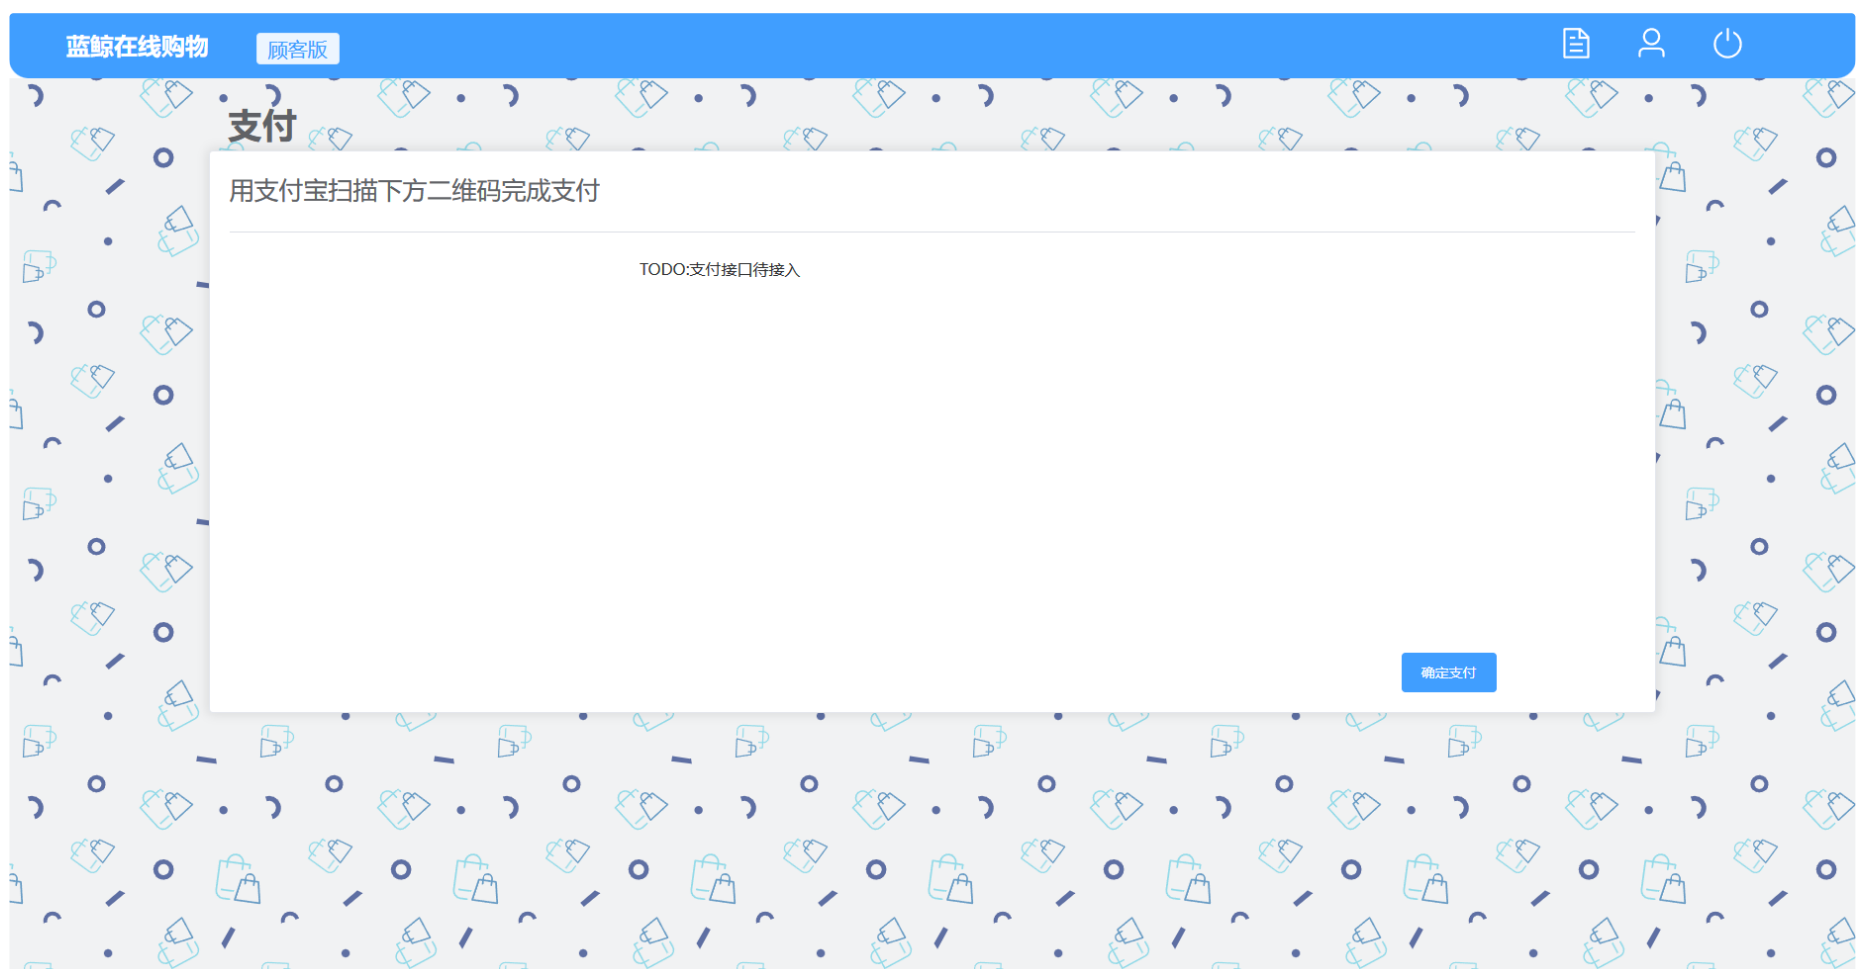

// 创建订单的请求方法

```
function createOrder() {
  reqOrderAdd({
    id: 0,
    itemId: productId.value,
    userId: userId.value,
    status: 'UNPAID',
    delivery: delivery.value,
    storeId: product.value.storeId,
    price: product.value.price,
    quantity: quantity.value
  }).then(res => {
    if (res.data.code === '000'){
      router.push({path: "/Payment/" + res.data.result})
    }
    else {
      ElMessage({
        message: "订单创建失败！",
        type: 'error',
        center: true
      })
    }
  })
}
```

```
}).catch(err => {  
  ElMessage({  
    message: "订单创建失败!",  
    type: 'error',  
    center: true  
  })  
})  
}
```

订单支付

- 对应lab文档需求2
- 顾客点击创建订单 之后，订单被创建，并且进入支付页面
- 点击确定支付 可以立即下单
 - 如果不点，直接返回的话订单也会被保存，状态为未支付

```
function payOrder() {  
  reqOrderPay({  
    orderId: parseInt(orderId.value)  
  }).then(res => {  
    if (res.data.code === '000') {  
      ElMessage({  
        message: '支付成功',  
        type: 'success'  
      })  
      router.push('/orders')  
    } else {  
      ElMessage({  
        message: '支付失败',  
        type: 'error'  
      })  
    }  
  })  
}
```

```
}  
})
```

订单页面

- 订单页面可以通过Header中的图标访问

```
<el-col :span="1" class="header-icon">  
  <router-link to="/orders" v-slot="{navigate}">  
    <el-icon @click="navigate" :size="35" color="white" ><Document /></el-  
icon>  
  </router-link>  
</el-col>
```

顾客订单页面

- 对应lab文档需求3
- 顾客能够访问自己的订单列表
- 订单列表包含一些必要的信息
- 针对不同状态的订单，用户可能会有相关操作，订单右端会出现操作的按钮
 - 操作包括确认收货，对应lab文档需求5

蓝鲸在线购物

商店工作人员订单页面

- 对应lab文档需求3
- 商店工作人员能访问自己商店的订单列表，其他商店是看不到的
- 看到的信息基本和顾客是一样的，只是操作的按钮不一样，商家只有一个确认发货的按钮

- 点击确认发货后库存会进行修改

蓝鲸在线购物 商家版

- 订单页面实现

```
<script setup lang="ts">
import OrderItem from "../components/OrderItem.vue";
import {reqAllOrder, reqOrderList, reqStoreOrderList} from
"../api/order.ts";
import {ref} from "vue";

const orderList = ref([])
const role = ref(sessionStorage.getItem('role'))
```

```
getOrders()

function getOrders(){
  // 根据用户角色获取订单列表
  if(role.value === 'CUSTOMER'){
    reqOrderList().then(res => {
      orderList.value = res.data.result
    })
  }
  if(role.value === 'STAFF'){
    reqStoreOrderList().then(res => {
      orderList.value = res.data.result
    })
  }
  if(role.value === 'CEO' || role.value === 'MANAGER'){
    reqAllOrder().then(res => {
      orderList.value = res.data.result
    })
  }
}
</script>

<template>
  <el-container style="display: flex; flex-direction: column; align-items: center" class="bgimage">
    <el-text style="width: 78%;text-align: left; font-size: 35px; font-weight: bold">订单列表</el-text>
    <el-card style="width: 80%">
      <OrderItem v-for="item in orderList" :key="item.createTime" :order-info="item" :is-store-order=true></OrderItem>
    </el-card>
  </el-container>
</template>

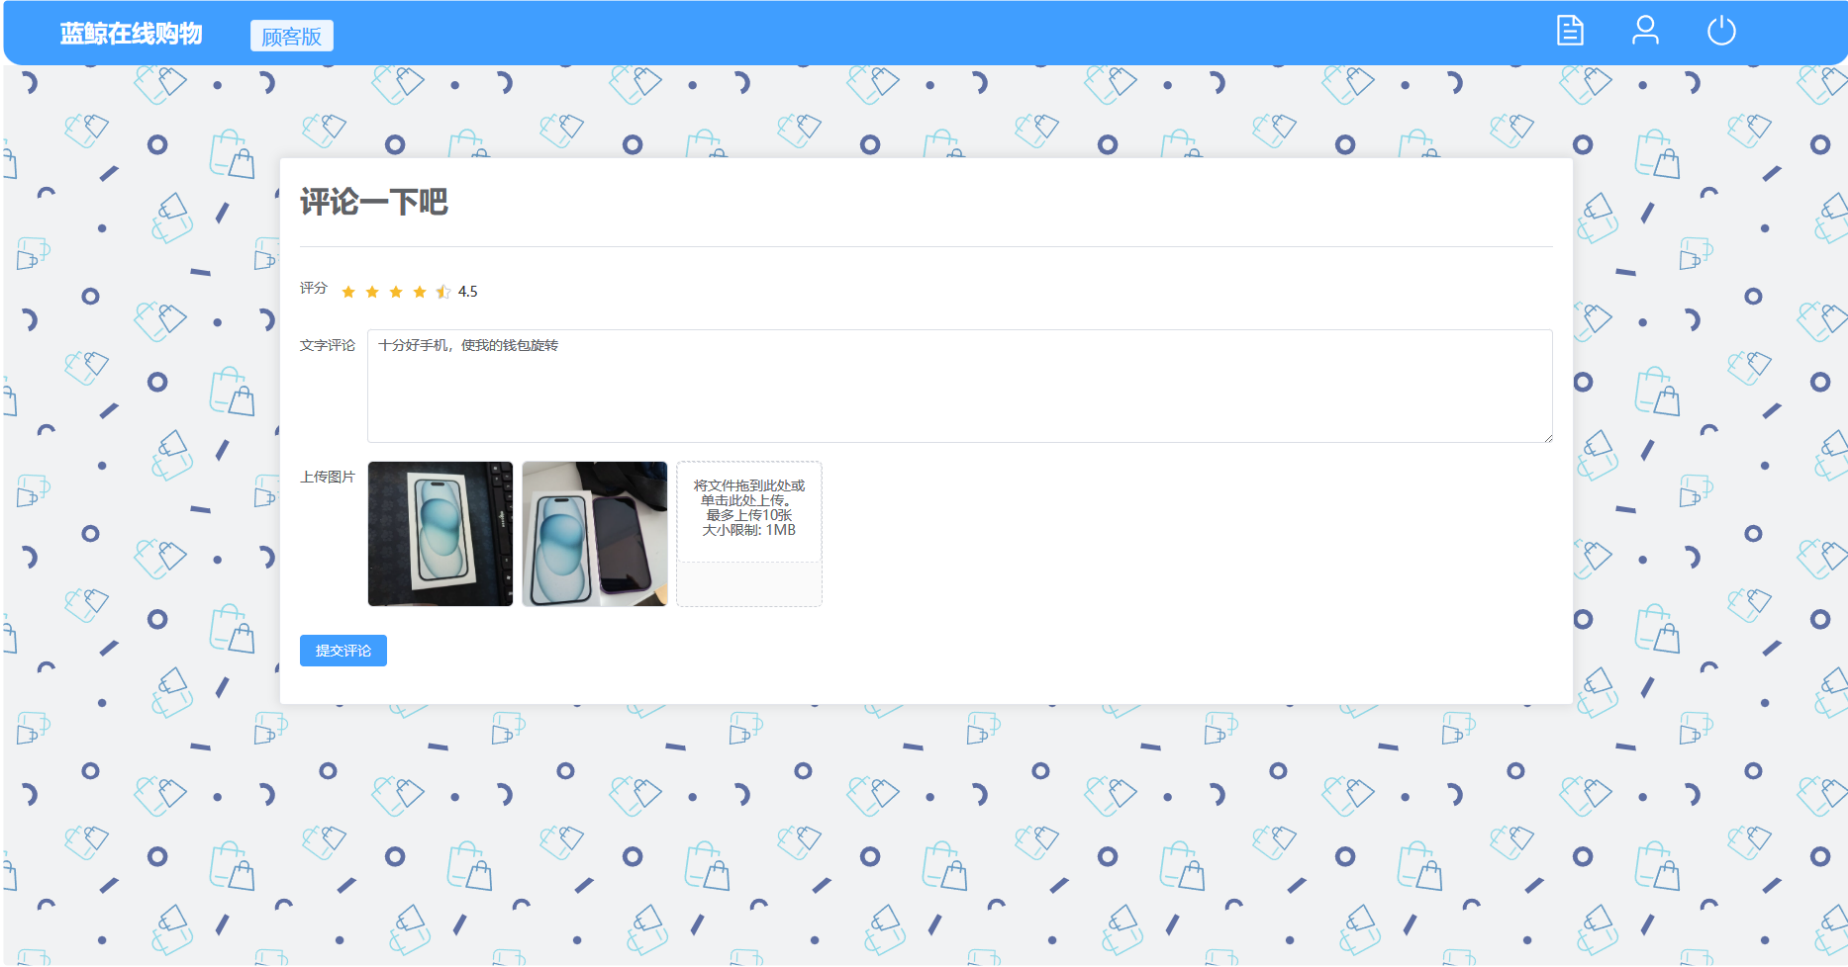

<style scoped>
.bgimage {
  background-image: url("../assets/shopping-1s-1084px.svg");
}
</style>
```

评论页面

新建评论

- 对应lab文档需求6
- 顾客可以对已收货的订单进行评论
- 需要输入的信息包括：

- 评分
 - 文字评论
 - 图片评论（可选）
- 评论后后端会自动计算评分，所以前端只需要上传评论就行啦

- 实现上和新建商品、新建商店类似

后端具体实现

评论模块

- 评论 (comment)

字段	类型	备注
id	unique identifier & not null & primary key	评论id
content	varchar(255) & not null	评论内容
itemId	int & not null	评论所属商品id
rating	float & not null	评分
userId	int & not null	发表评论用户id
create_time	varchar(255)	评论时间
order_id	int & not null	评论所属订单id

获取商品评论列表

- 商品详情界面会请求评论列表。
- 采用懒加载的策略，请求时只会返回部分评论。
- 实现细节
 - 请求体要包含商品id 和初始下标

- 只返回商品所有评论列表中从初始下标开始的评论。返回个数可以修改，为了测试方便，一次懒加载只返回两个评论。

```
@Override
public List<CommentV0> getCommentByItemIdAndCount(Integer itemId, Integer
startInd) {
    // 一次返回的评论数量，为了保证展示效果，这里设置为2
    int loadCount = 2;
    List<Comment> allComments = commentRepository.findByItemId(itemId);
    List<Comment> poList;
    List<CommentV0> voList = new ArrayList<>();
    if (startInd + loadCount ≤ allComments.size()) {
        // 如果还有更多评论未加载
        poList = allComments.subList(startInd, startInd + loadCount);
    }
    else{
        // 如果所有评论都已加载
        poList = allComments.subList(startInd, allComments.size());
    }
    for(Comment comment : poList){
        voList.add(comment.toV0());
    }
    return voList;
}
```

获取商品评论总条数

- 因为采用了懒加载的策略，前端基本无法通过一次请求就获取到所有的评论，从而就无法得到评论总条数
- 实现细节
 - 统计总条数并返回就行

```
@Override
public Integer getCommentCountByItemId(Integer itemId) {
    List<Comment> comments = commentRepository.findByItemId(itemId);
    return comments.size();
}
```

新建评论

- 新增评论，并同步更新商店和商品的评分
- 实现细节
 - 更新商品评分时，直接遍历商品的所有评论算一遍就行。这样虽然牺牲了性能，但保证了数据不会出问题。（直接用公式计算新的评分在不当操作下会出bug）
 - 更新商店评分时，要将没有评论的商品（即评分为0）过滤掉，否则会降低商家的评分参考性。

```
@Override
public Integer appendComment(CommentV0 commentV0) {
```

```

        Comment newComment = commentVO.toPO();
        newComment.setCreateTime(new Date());
        Comment saveComment = commentRepository.save(newComment);
        // 更新相关Rating
        updateItemRating(saveComment.getItemId(), saveComment.getRating());
        updateStoreRating(saveComment.getItemId(), saveComment.getRating());
        return saveComment.getId();
    }

    // 根据评论更新商品Rating
    private void updateItemRating(Integer itemId, float rating){
        Item item = itemRepository.findById(itemId.intValue());
        List<Comment> comments = commentRepository.findByItemId(itemId);

        float ratingSum = 0;
        for(Comment c : comments){
            ratingSum += c.getRating();
        }
        float newRating = (ratingSum + rating) / (comments.size() + 1);
        item.setRating(newRating);
        itemRepository.save(item);
    }

    // 根据评论更新商家Rating
    private void updateStoreRating(Integer itemId, float rating){
        Item item = itemRepository.findById(itemId.intValue());
        int storeId = item.getStoreId();

        Store store = storeRepository.findById(storeId);
        List<Item> items = itemRepository.findByStoreId(storeId);

        // 只计算有评分的商品，否则商家太惨了
        float ratingSum = 0;
        int validRatingCount = 0;

        for(Item i : items){
            if(i.getRating() != 0){
                validRatingCount ++;
                ratingSum += i.getRating();
            }
        }
        float newRating = ratingSum / validRatingCount;
        store.setRating(newRating);
        storeRepository.save(store);
    }
}

```

订单模块

- 订单 (order)

字段	类型	备注
id	unique identifier & not null & primary key	订单id
itemId	int & not null	订单商品id
userId	int & not null	购买者id
status	varchar(255) & not null	订单状态
delivery	varchar(255) & not null	提货方式
storeId	int & not null	所属商店id
coupon	varchar(255) & not null	优惠券使用情况(待定)
price	float & not null	价格(商品单价)
quantity	int & not null	数量
create_time	varchar(255)	订单创建时间
send_time	varchar(255)	订单发货时间
receive_time	varchar(255)	订单收货时间

获取订单列表

- 前端会请求订单列表。分三种请求：请求所有订单、请求某个商店的订单、请求某个用户的订单。
- 实现细节
 - 对这三种请求，面向前端写三个请求接口。
 - 请求订单列表前，后端检查用户身份或所属商店是否与请求符合。
 - 若符合，则返回对应列表

```
@Override
public List<OrderVO> getAll() {
    User user = securityUtil.getCurrentUser();
    // 只有CEO和MANAGER可以查看所有订单
    if(user.getRole() != RoleEnum.CEO && user.getRole() !=
RoleEnum.MANAGER){
        throw AuthorityException.notAllowToOperate();
    }
    List<Order> poList = orderRepository.findAll();
    List<OrderVO> voList = new ArrayList<>();
    for(Order po : poList){
        voList.add(po.toVO());
    }
    return voList;
}

@Override
```

```

public List<OrderV0> getByUserId() {
    User user = securityUtil.getCurrentUser();
    int userId = user.getId();
    List<Order> poList = orderRepository.findByUserId(userId);
    List<OrderV0> voList = new ArrayList<>();
    for(Order po : poList){
        voList.add(po.toV0());
    }
    return voList;
}

@Override
public List<OrderV0> getByStoreId() {
    User user = securityUtil.getCurrentUser();
    int storeId = user.getStoreId();
    List<Order> poList = orderRepository.findByStoreId(storeId);
    List<OrderV0> voList = new ArrayList<>();
    for(Order po : poList){
        voList.add(po.toV0());
    }
    return voList;
}

```

创建订单

- 用户点击购买并确认信息之后订单被创建。
- 订单状态初始值为 *UNPAID*
- **实现细节**
 - 先校验用户身份，非本人无法创建订单
 - 尽管前端也对库存做了校验，后端再校验一遍会更安全
 - 校验后创建订单，给订单标记创建时间，返回订单id

```

@Override
public Integer createOrder(OrderV0 orderV0) {
    // 安全校验
    User user = securityUtil.getCurrentUser();
    Item item = itemRepository.findById(orderV0.getItemId().intValue());
    if(!authorityCheck(user.getId(), orderV0.getUserId())){
        // 非本人无法操作
        throw AuthorityException.notAllowToOperate();
    }
    if(item.getInventory() < orderV0.getQuantity()){
        // 库存不足
        throw ItemException.inventoryNotEnough();
    }
    // 附上系统时间
    orderV0.setCreateTime(new Date());
    Order orderToCreate = orderV0.toPO();
}

```

```
        Order orderSaved = orderRepository.save(orderToCreate);
        return orderSaved.getId();
    }
```

支付订单

- 前端支付订单的请求接口
- 目前只有如下功能，后续随着支付API的提供会增加功能：
 - 校验用户信息
 - 将订单状态从 *UNPAID* 转换到 *UNSEND* 的功能
- 实现细节

```
@Override
public Boolean purchaseOrder(int orderId) {
    User user = securityUtil.getCurrentUser();
    Order order = orderRepository.findById(orderId);
    if(order == null){
        // 订单不存在
        throw OrderException.orderNotExist();
    }
    if(!authorityCheck(user.getId(), order.getUserId())){
        // 非本人无法操作
        throw AuthorityException.notAllowToOperate();
    }
    if(order.getStatus() != OrderStatus.UNPAID){
        // 订单状态不符合要求
        throw OrderException.orderStatusError();
    }
    // 将订单状态更新为未发货
    switchOrderStatus(order, OrderStatus.UNSEND);
    return true;
}
```

订单确认发货

- 商家发货后，在平台上将订单状态更新为已发货 (*UNGET*)
- 实现细节
 - 校验店员身份
 - 校验订单状态
 - 改变订单状态

```
@Override
public Boolean sendOrder(int orderId) {
    User user = securityUtil.getCurrentUser();
    Order order = orderRepository.findById(orderId);
    if(order == null){
```

```

        // 订单不存在
        throw OrderException.orderNotExist();
    }
    if(user.getStoreId().intValue() != order.getStoreId().intValue()){
        // 非本店无法操作
        throw AuthorityException.notAllowToOperate();
    }
    if(order.getStatus() != OrderStatus.UNSEND){
        // 订单状态不符合要求
        throw OrderException.orderStatusError();
    }
    // 将订单状态更新为已发货
    switchOrderStatus(order, OrderStatus.UNGET);
    // 将订单发货时间更新为当前时间
    order.setSendTime(new Date());
    orderRepository.save(order);
    return true;
}

```

订单确认收货

- 顾客收货后，在平台上点击确认收货，订单状态将改变为已收货(UNCOMMENT)
- 实现细节
 - 校验操作者身份
 - 校验订单状态
 - 改变订单状态

```

@Override
    public Boolean receiveOrder(int orderId) {
        User user = securityUtil.getCurrentUser();
        Order order = orderRepository.findById(orderId);
        if(order == null){
            // 订单不存在
            throw OrderException.orderNotExist();
        }
        if(!authorityCheck(user.getId(), order.getUserId())){
            // 非本人无法操作
            throw AuthorityException.notAllowToOperate();
        }
        if(order.getStatus() != OrderStatus.UNGET){
            // 订单状态不符合要求
            throw OrderException.orderStatusError();
        }
        // 将订单状态更新为已收货
        switchOrderStatus(order, OrderStatus.UNCOMMENT);
        // 将订单收货时间更新为当前时间
        order.setReceiveTime(new Date());
        orderRepository.save(order);
    }

```

```
        return true;
    }
```

评价订单

- 注意：此接口只负责改变订单状态，并不负责评论模块的相关功能
- 用户评价订单后，订单的状态将改变为已评价(DONE)
- 实现细节
 - 校验操作者身份
 - 校验订单状态
 - 改变订单状态

```
@Override
public Boolean commentOrder(int orderId) {
    User user = securityUtil.getCurrentUser();
    Order order = orderRepository.findById(orderId);
    if(order == null){
        // 订单不存在
        throw OrderException.orderNotExist();
    }
    if(!authorityCheck(user.getId(), order.getUserId())){
        // 非本人无法操作
        throw AuthorityException.notAllowToOperate();
    }
    if(order.getStatus() != OrderStatus.UNCOMMENT){
        // 订单状态不符合要求
        throw OrderException.orderStatusError();
    }
    // 将订单状态更新为已评论
    switchOrderStatus(order, OrderStatus.DONE);
    return true;
}
```

前端订单模块实现代码

- /src/api/order.ts
- 订单网络请求

```
import {axios} from "../utils/request.ts";
import {ORDER_MODULE} from "../_prefix";

export type OrderInfo = {
    id: number,
    itemId: number,
    userId: number,
    status: string,
    delivery: string,
```

```
storeId: number,  
price: number,  
quantity: number  
}
```

// 请求订单

```
export const reqOrder = (orderId: {orderId: number}) => {  
  return axios.get(`${ORDER_MODULE}/id`, {params: orderId})  
    .then(res => {  
      return res;  
    })  
}
```

// 请求所有订单

```
export const reqAllOrder = () => {  
  return axios.get(`${ORDER_MODULE}/all`)  
    .then(res => {  
      return res;  
    })  
}
```

// 请求订单列表(根据用户id)

```
export const reqOrderList = () => {  
  return axios.get(`${ORDER_MODULE}/user`)  
    .then(res => {  
      return res;  
    })  
}
```

// 请求订单列表(根据商店id)

```
export const reqStoreOrderList = () => {  
  return axios.get(`${ORDER_MODULE}/store`, )  
    .then(res => {  
      return res;  
    })  
}
```

// 请求创建订单

```
export const reqOrderAdd = (orderInfo: OrderInfo) => {  
  return axios.post(`${ORDER_MODULE}/create`, orderInfo)  
    .then(res => {  
      return res;  
    })  
}
```

// 请求删除订单

```
export const reqOrderDelete = (orderId: {orderId: number}) => {  
  return axios.post(`${ORDER_MODULE}/delete`, null, {params: orderId})  
    .then(res => {  
      return res;  
    })  
}
```

```

})
}

// 请求支付订单
export const reqOrderPay = (orderId: {orderId: number}) => {
  return axios.post(`${ORDER_MODULE}/purchase`, null, {params: orderId})
    .then(res => {
      return res;
    })
}

// 请求发货
export const reqOrderSend = (orderId: {orderId: number}) => {
  return axios.post(`${ORDER_MODULE}/send`, null, {params: orderId})
    .then(res => {
      return res;
    })
}

// 请求收货
export const reqOrderReceive = (orderId: {orderId: number}) => {
  return axios.post(`${ORDER_MODULE}/receive`, null, {params: orderId})
    .then(res => {
      return res;
    })
}

// 请求评论
export const reqOrderComment = (orderId: {orderId: number}) => {
  return axios.post(`${ORDER_MODULE}/comment`, null, {params: orderId})
    .then(res => {
      return res;
    })
}

```
